

**Rainbow Probe** is a non-contact chromatic confocal sensor that measures surfaces by analyzing changes in the optical spectrum as a function of part to probe spacing. Additional capabilities include:

- Measurement Advantages Rainbow Probe easily measures transparent, translucent, fragile, liquid, or easily deformable surfaces. The Rainbow Probe also has dual measuring modes for select distance or thickness measuring mode.
- **Right Probe Right Application** A range of CL-series and RP1500 probes are available, each with a unique measuring range, working distance, axial resolution, accuracy, and spot size.
- Multisensor Integration Integrates into automatic measurements with other sensors on measurement systems.

High Resolution, Non-Contact Optical Sensor for Surface Measurements

The RP1500's 32 mm working distance and 40 nm resolution make it the probe of choice for many applications.

<sup>1</sup>Includes CCS PRIMA control box.

<sup>2</sup>In distance measuring mode. In thickness measuring mode, the accuracy depends on sample characteristics (material, thickness). System performance varies depending on machine type. Rainbow Probe calibration certificate included for each sensor, with test protocol.

<sup>3</sup>For specular (perfectly reflecting) samples. For diffuse objects, the maximum object slope can reach 87°.

<sup>4</sup>In distance measuring mode. In thickness measuring mode; the axial resolution is given by: Rth = n\*Rd (Rd = axial resolution in distance mode, Rth = axial resolution in thickness mode, n = refractive index of the sample).
